Weekly Student Progress Performa

Team Id	CS26084	**Week no / Date**	Week 9 14 September 2026
Project Title	SentinelCore: A Network Detection and Incident Response Platform		
Members Present	Om Rashiya (24cs084), Yash Patel (24cs082)		
Mentor	Akshita Kadam		

WEEK 9 • Incident Lifecycle and Evidence Management

Section	Details to be filled by the team
Planned Tasks (from last week)	Integrate M1–M5 work and implement the analyst incident lifecycle.
Tasks Completed This Week	Merged authentication, asset discovery, sensor, and event-pipeline foundations in one reviewed milestone. Added incident creation from candidates, human-readable numbering, status/severity/assignee changes, event attachment, comments, and append-only incident history.
Commits Made	Total: 1 major consolidated commit. d79a37c — “update the project to m5” (authentication, assets, sensor, pipeline, tests, and UI foundation).
Issues Created / Closed	Created: Candidates needed traceable promotion without losing original evidence. Closed: Incident records retain candidate/event relationships and record every lifecycle change in history.
Milestone Status	~73% complete — on track. The platform supported discovery through investigation as one integrated workflow.
Blockers / Challenges Faced	The milestone was large because related database migrations, worker logic, API contracts, tests, and frontend screens had to land together.
Plan for Next Week	Finalize search/correlation commits, reporting, scheduled generation, and safe firewall containment.

Research and Technical Study

Research objective. Integrate M1–M5 work and implement the analyst incident lifecycle.

Study completed. Reviewed incident-response case management, chain of custody, analyst assignment, evidence preservation, and append-only change history. The model separates machine-generated candidates from analyst-managed incidents while maintaining the source trail.

Incident lifecycle and evidence mapping

Lifecycle area	Stored information	Analyst outcome
Promotion	Candidate, rule, and events	Finding becomes a traceable case
Triage	Severity, score, assignee	Work can be prioritized and owned
Investigation	Comments and linked evidence	Reasoning stays with the case
Containment	Status and response link	Action remains tied to evidence
Closure	Resolution note and history	Final decision is reviewable

Decision carried into the project

Merged authentication, asset discovery, sensor, and event-pipeline foundations in one reviewed milestone. Added incident creation from candidates, human-readable numbering, status/severity/assignee changes, event attachment, comments, and append-only incident history.

Implementation Record and Website Evidence

Promotion and identity

Candidates can be promoted to incidents while retaining the originating rule and linked events. Incidents receive human-readable sequential numbers for communication in the analyst workflow.

Lifecycle controls

Implemented new, triage, investigating, contained, resolved, and false-positive states together with severity, score, assignment, acknowledgement, closure, and required resolution information.

Evidence and history

Events can be attached to or removed from an incident, comments can be recorded, and lifecycle changes are written to append-only history so the case remains explainable.

Incident queue

The website groups work into My open, Unassigned, All open, Critical, and Recently closed views and displays severity, title, status, assignee, age, evidence count, and last activity.

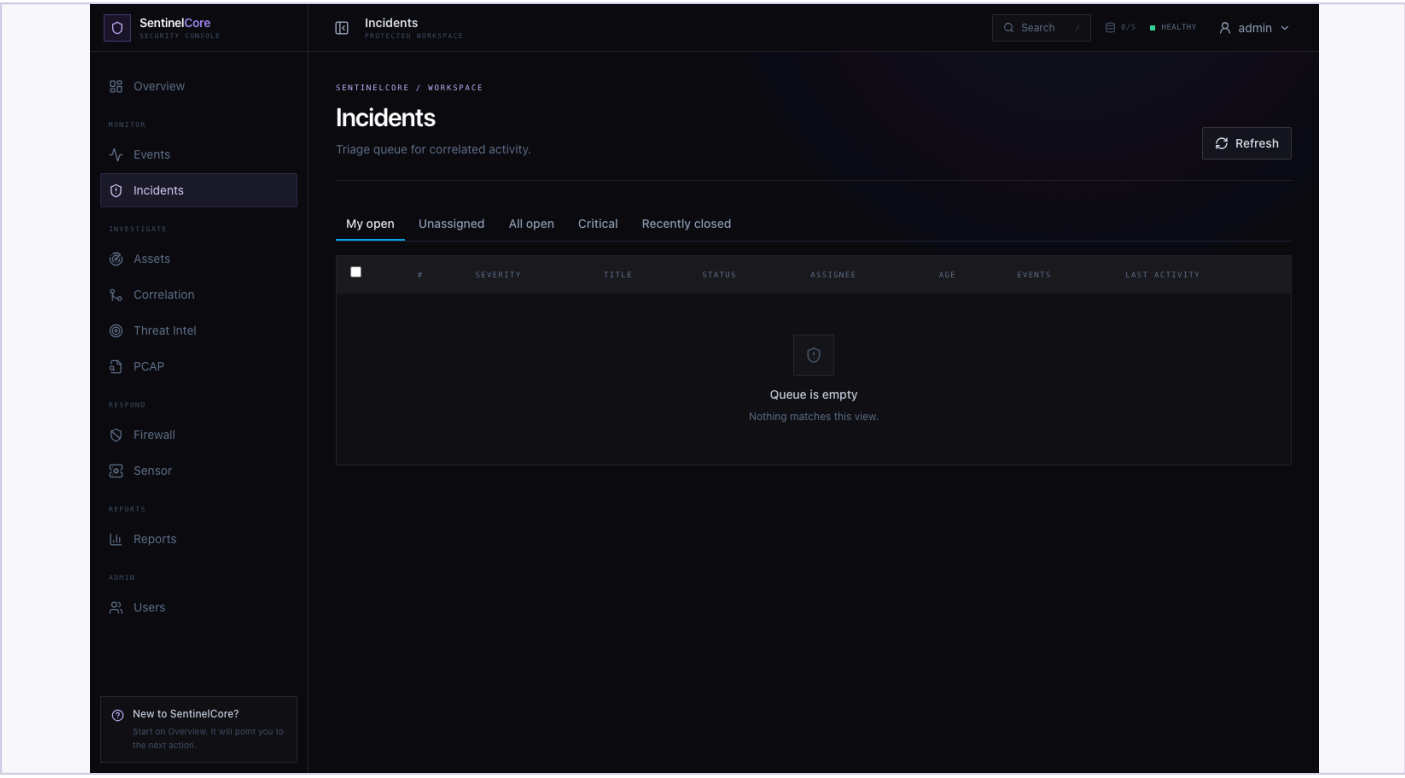

Figure W9.1 — Project-owned SentinelCore interface mapped specifically to Week 9.

Evidence interpretation. The Incidents workspace presents analyst queue tabs, sortable case columns, refresh control, and an empty state when the selected view has no matching cases. Its visible controls, labels, status fields, and navigation provide direct evidence for the work described on this page.

Repository and Architecture Evidence

Incident queue implementation

frontend/src/pages/incidents/IncidentsPage.jsx

```
16
17  const AUTO_REFRESH_MS = 30_000;
18
19  export default function IncidentsPage() {
20    const { user } = useAuth();
21    const toast = useToast();
22    const navigate = useNavigate();
23
24    const [tab, setTab] = useState("my_open");
25    const [incidents, setIncidents] = useState([]);
26    const [loading, setLoading] = useState(true);
27    const [newCount, setNewCount] = useState(0);
28    const [selected, setSelected] = useState(new Set());
29    const [cursorRow, setCursorRow] = useState(0);
30    const [bulkAction, setBulkAction] = useState(null); // "status" | "assign" | "close"
31    const [bulkNote, setBulkNote] = useState("");
32    const [submitting, setSubmitting] = useState(false);
33
34    const knownIds = useRef(new Set());
35
36    const load = useCallback(
37      async (silent = false) => {
38        if (!silent) setLoading(true);
39        try {
```

Repository evidence captured directly from the SentinelCore workspace

Figure W9.2 — Incident queue implementation. This is a separate internal artifact, not a copy of the website image.

Repository files used for traceability

- reports/modules/M08-incidents_1.md
- frontend/src/pages/incidents/IncidentsPage.jsx
- frontend/src/pages/incidents/IncidentDetail.jsx
- backend/app/api/routes/incidents.py

Verification

Incident states, queue labels, evidence links, and commit information were matched to repository code, specifications, and history.

Traceability conclusion. Incident queue implementation directly supports the Incident Lifecycle and Evidence Management milestone. Incident states, queue labels, evidence links, and commit information were matched to repository code, specifications, and history. The artifact, source paths, implementation record, and website evidence therefore describe the same weekly scope.

Weekly Closure and Faculty Assessment

Completed outcome

Merged authentication, asset discovery, sensor, and event-pipeline foundations in one reviewed milestone. Added incident creation from candidates, human-readable numbering, status/severity/assignee changes, event attachment, comments, and append-only incident history.

Commit record

Total: 1 major consolidated commit. d79a37c — “update the project to m5” (authentication, assets, sensor, pipeline, tests, and UI foundation).

Issue and resolution

Created: Candidates needed traceable promotion without losing original evidence. Closed: Incident records retain candidate/event relationships and record every lifecycle change in history.

Milestone position

~73% complete — on track. The platform supported discovery through investigation as one integrated workflow.

Challenge handled

The milestone was large because related database migrations, worker logic, API contracts, tests, and frontend screens had to land together.

Next-week hand-off

Finalize search/correlation commits, reporting, scheduled generation, and safe firewall containment.
